Coastal CUBEnet

- The Northern Gulf of Mexico is fast becoming the go-to maritime test range for DARPA, DHS S&T, ERDC, NRL, and other Federal R&D agencies.
- To support the emerging requirements USM's has developed its Coastal CUBEnet Environment.
- The CUBEnet with its Environmental Intelligence (EI) infrastructure is a high-resolution, coastal ocean sensor, modeling, and data sharing network that provides the integrated infrastructure needed for collaborative ocean research products.
- This specifically includes high-resolution products needed for the testing and evaluate of UMS.
- The EI provides the networked Blue Economy stakeholders with the ability to access models, and high-resolution data for real-time or near-real Gulf coastal policy decisions with much greater accuracy and confidence.

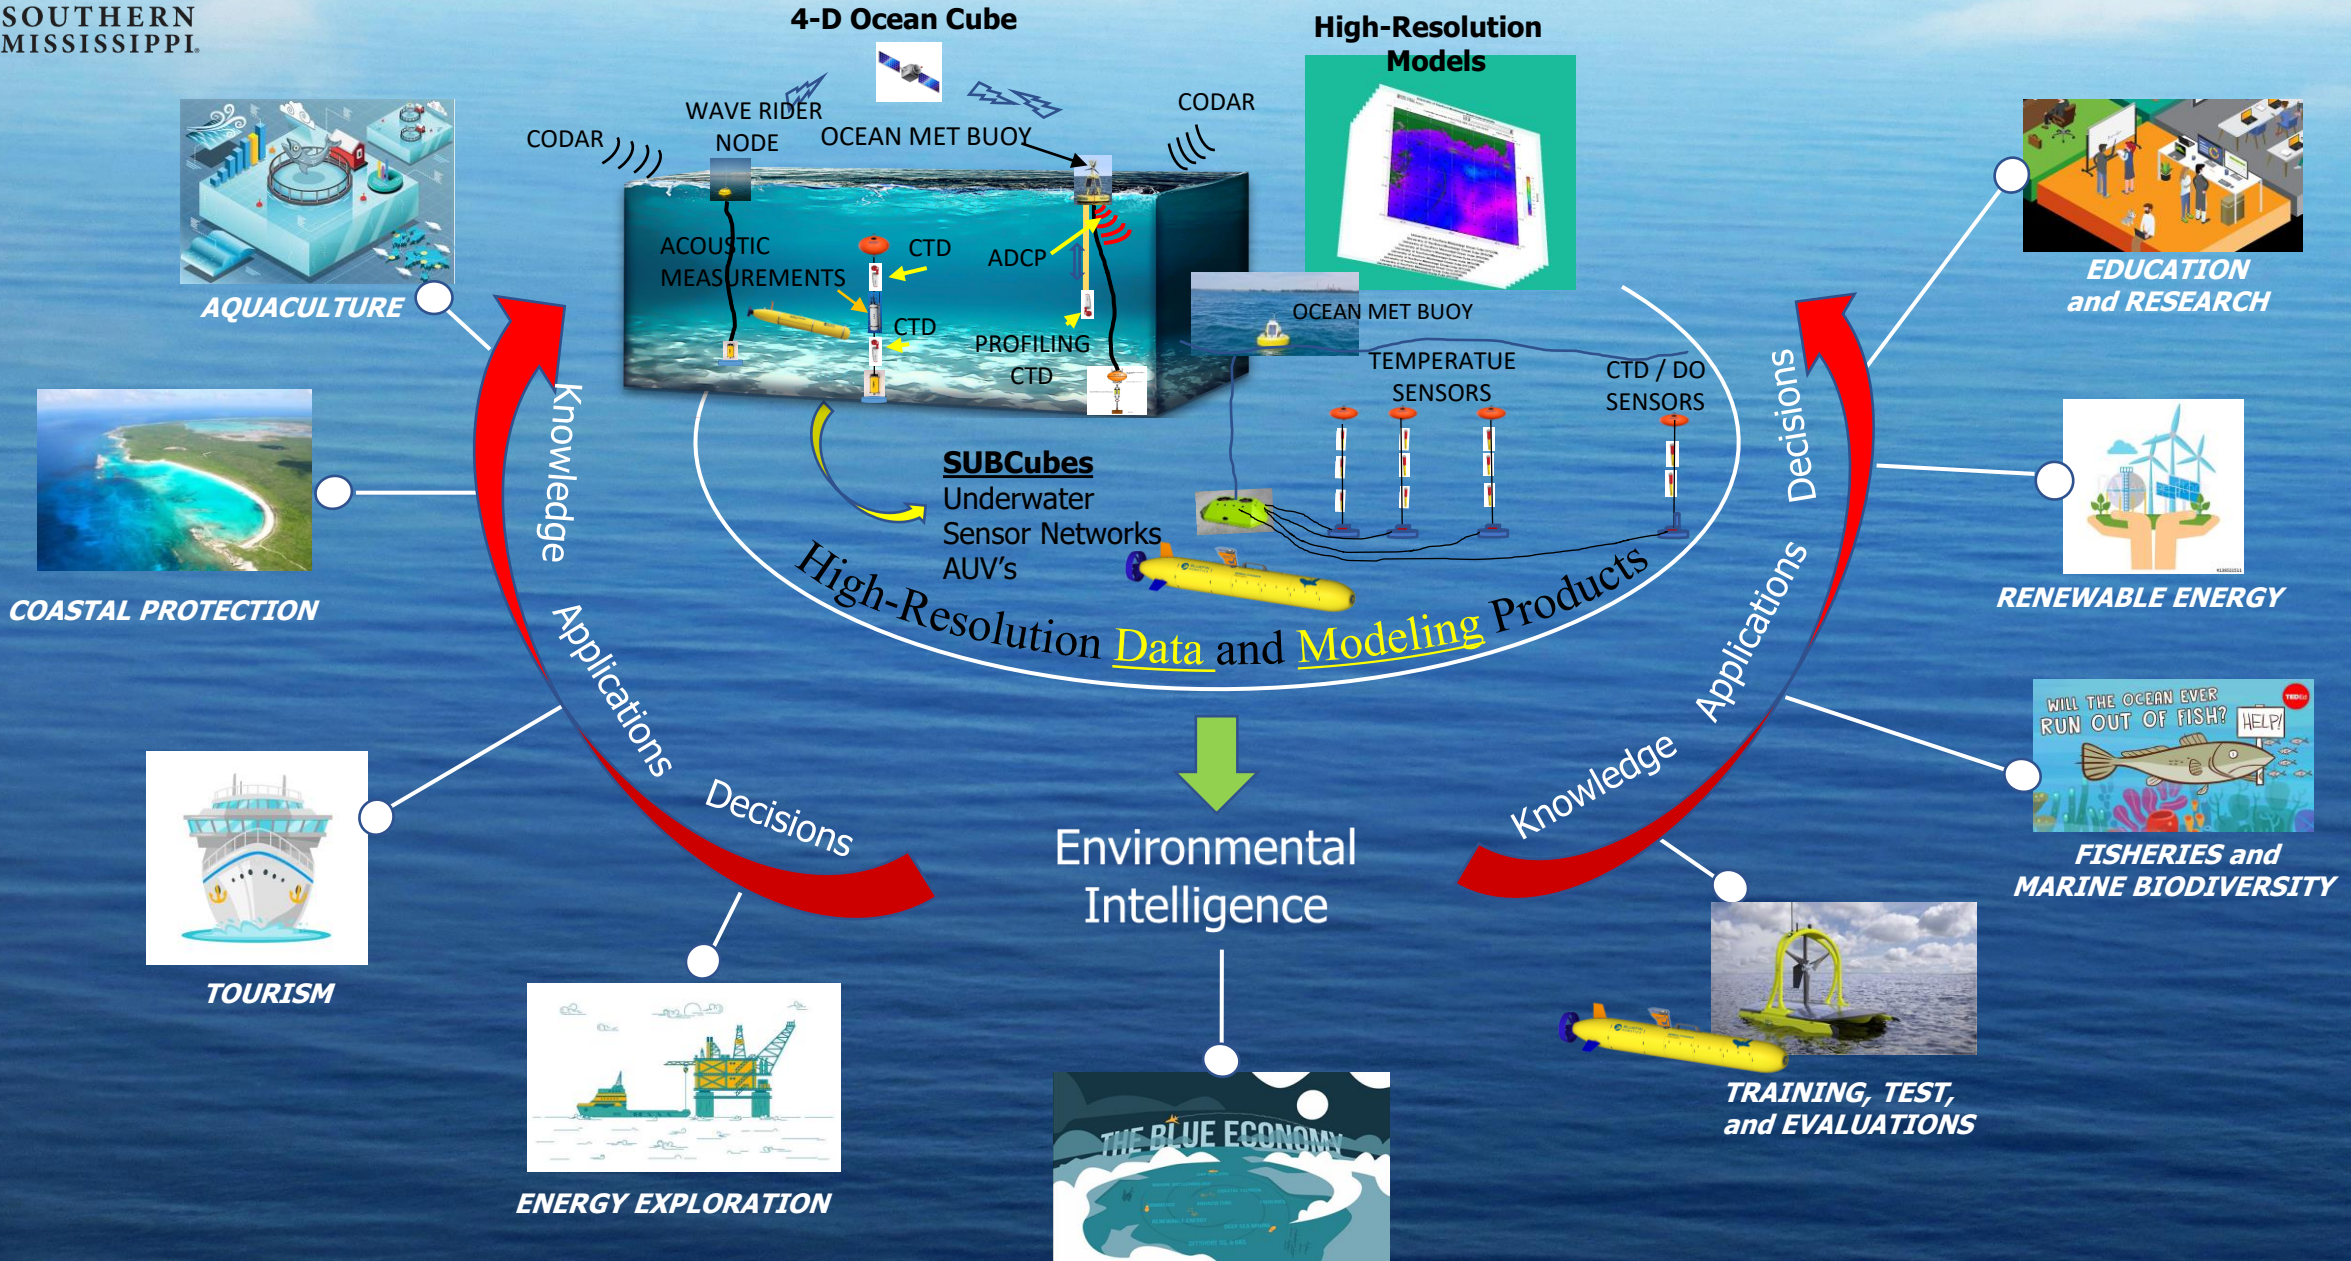

Coastal CUBEnet

- USM’s EI network is a platform for the ongoing development of hydrodynamic, machine learning, and other artificial intelligence models.
- The CUBEnet and its EI offers the opportunity to bring in expertise, insights, methods, and tools from multiple disciplines.
 - Oceanography
 - Climate science
 - Biology
 - Natural resource management
 - Coastal and ocean engineering
 - Computer/data science
 - Public policy
 - Economics

Coastal CUBEnet Summary

- To support emerging unmanned vehicle testing requirements USM's has developed its Coastal CUBEnet Environment.
- Coastal CUBEnet's EI mission is to provide comprehensive Nowcasts and Forecasts in support of unmanned vehicle testing.
- Coastal CUBEnet displays high-frequency radar observations, bathymetry, acoustic noise, current, temperature, salinity, and density profiles along, meteorological information.
- Coastal CUBEnet extracts and displays the data from these widely used ocean and acoustic models, HYCOM, AMSEAS, NGOFS2, and BellHop.
